Redesigning the process

Complete

Once we've analysed the gap(s) preventing a system or process from achieving the desired future state of the business, we must redesign the process or system to address those gaps.

Why redesign?

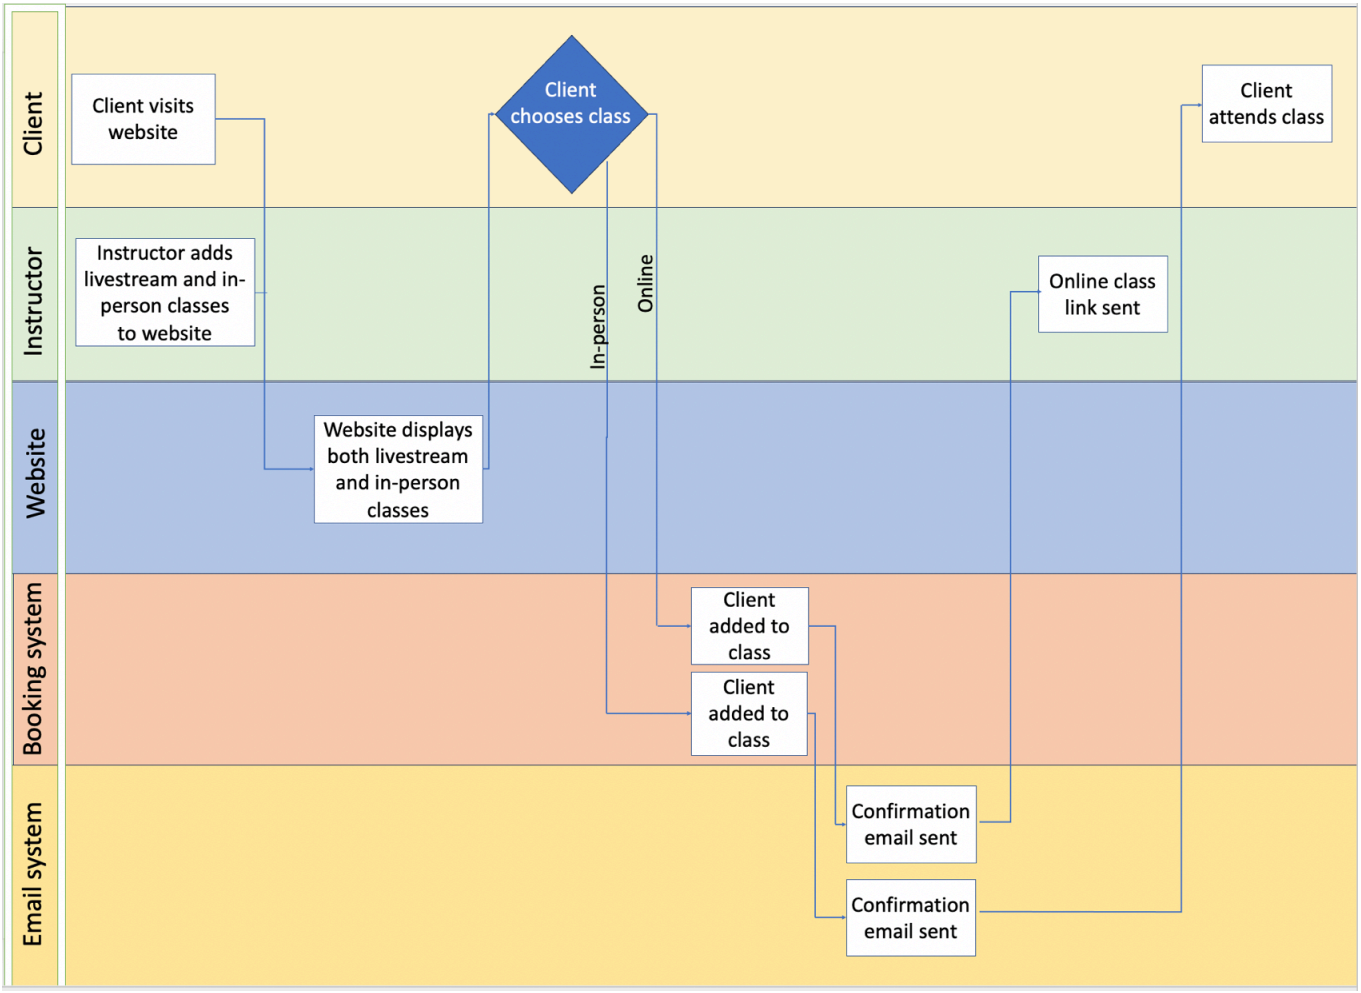

The redesign allows you to take all your learnings about what is getting in the way of the current process from achieving your desired results. It paints a clear, more specific, picture of the new and improved process before you start developing an action plan to implement it.

Models that support a redesign

1. **Process models:** used to show current and future states
2. **Data models:** used to show relationships between data
3. **Communication models:** used to show the flow of communication
4. **Use cases:** a written description of how a user will interact with the service or product—directly linked to user stories

Let's return to Flexi Yoga to see a redesigned process for online class bookings:

💡 *As you are reviewing the process model, look for ways in which the gaps identified in the fishbone diagram are being addressed.*

Why a swimlane diagram?

In the above scenario, a swimlane diagram effectively visualises the redesigned process model. Here's why:

- **Swimlane diagrams are specifically used to map out processes and workflows,** showing the sequence of activities and which actors/roles are responsible for each activity. This makes them well-suited for modelling a redesigned business process like Flexi Yoga's new online class delivery process.
- **Swimlane diagrams allow you to visually distinguish different lanes for each role or system involved in the process**. This would allow Flexi Yoga to map out both the instructor role and the technology systems in delivering virtual classes.
- **Swimlane diagrams provide a clear visualisation of how work flows between different roles, systems, or departments**. This will help Flexi Yoga optimise the handoffs in the redesigned process.
- **The swimlane format will map out the workflow and responsibilities**

more clearly.
